CHAPTER II
METHOD OF STUDY

This thesis was being done by using library research. I use some books and many other sources as references that I think related to the subject matter that is being analyzed. Those books are the analyses of intrinsic elements that are written by many scholars and I also browse some opinions about the intrinsic elements in Oliver Twist from the internet to add my understanding.

In doing the analysis, I use some steps as follows:

2.1 Data Collecting

For the first step, I read the novel on and on to get full understanding about what is being told about and to find out the intrinsic elements that are contained in the novel. I don’t read the English version only, but also the translation version. The primary source of the data is the text itself. I underlined and collected the important things from the novel such as the information about the characteristics of each character, the way the characters interact with others, and the ideas that the characters posses in facing an event in the novel.

2.2 Data Selecting

The second step is selecting the data. All the information that I had collected in the first step were being selected and only the very significant data or related data were used in the process of making the analysis of this thesis. The selection is based on the characters that are discussed, because the selected data is used to support the character that is being discussed.
2.3 Data Analyzing

The last step is analyzing the data. I use the descriptive method in analyzing the data. Descriptive method is a method of analysis by describing and analyzing the data and then giving interpretation and explanation. All the selected data were being analyzed to prove what are being written in the objective of this thesis and finally I can draw the conclusion for this thesis.
