Zara Fatia/Student of Faculty of Nursing/University of Sumatera Utara, Indonesia

Abstract
Immunization is one of the most effective health interventions in decreasing infant and toddler mortality rate. Immunization can give protection for infant and decrease the infection spreading. Therefore, it is need to identify the family member's role in providing some support, informational, assessing and emotional support. To find out the correlation between family support to an infant's basic immunization status in Posyandu Kelurahan Merdeka Kecamatan Medan Baru. This research used descriptive correlative analytic research. There are 41 samples involved by using total sampling technique. This research was conducted in Posyandu Kelurahan Merdeka Kecamatan Medan Baru. Chi square technique applied in analyzing data. The research result showed that there were majority of respondents (70.7%) in the range age of 20-30 years old, all of respondents (100%) were female. more than half respondents (88.3%) had the senior high school level of education and majority of respondents (85.4%) had salary less than Rp.1.000.000. Majority of respondents had family support (82.9%) and had suitable basic immunization status (75.5%). The result also gave evidence that there was a correlation between family support and the basic immunization status of infant's (p<0.05). The findings of this study proved that family support is very important to the infant's immunization status can be appropriate with their age. Therefore, it is expected to the health staff to involve family in giving support, motivation and information.
Keywords: Family Support, Basic Immunization, Infant

SELF ESTEEM AND SELF ACTUALIZATION OF OBESITY YOUTH

Abstract
Obesity youth have low self-esteem than youth who have ideal body. This may affect their self-actualization and their self-confidence to interact with other people. This study aims to identify correlation between self esteem and self-actualization among obesity youth at SMA Negeri 1 Set Bingai. The research design was a descriptive correlation. Sample was 35 people with total sampling. The data was collected using a demographic data, self-esteem questionnaire, and self-actualization questionnaire. Processed data using descriptive analysis and Spearman Correlation. The result showed 65.7% respondent have lower self-esteem of obesity youth, 34.3% respondent have lower self-actualization of obesity youth and there was correlation between self esteem and self-actualization of youth obesity (p < 0.05, r = 0.646). The result of research as the basis to carry out further research related to self-esteem and self-actualization of obesity girls in another senior high school.
Keywords: Obesity, Female, Self Esteem, Self Actualization.
