The 1st Public Health International Conference (PHICo 2016) will be held on 1st and 2nd of December 2016 in Medan, North Sumatra, Indonesia. The organizing committee of PHICo 2016 devotes itself to supply to you and all conference participants the most cutting-edge updated information relevant to public health.

The PHICo 2016 program consists of interactive presentation sessions, keynote presentations from experts in the related fields, case studies and social events including a cultural show along with the networking dinner, and post conference tour. We assure that you will find what you expected to see and experience with PHICo 2016.

Please click here for the conference website.

Proceedings of the 1st Public Health International Conference (PHICo 2016)

PHICo stands for Public Health International Conference, which is planned to be held every year, especially during the anniversary of public health faculty, Universitas Sumatera Utara, Indonesia. PHICo is an effort to show that world health issues can be shared and sought solving together with academics, experts, observers, consultants, government and parties related to health problems. The first PHICo was held on December 1-2, 2016. The theme was Tropical Health and Universal Coverage, and the sub-theme is Reaching Universal Coverage in Managing Tropical Diseases. This was due to the problem of climate-change impacts, which are the priority of discussion of public health experts around the world.

Because the field of public health was too broad, then, in order to be more specifically discussing the impact of climate change, the papers are being divided again by the field of public health (panels). The panels are the Environmental Health and Safety, Epidemiology and Surveillance, Health Promotion, Health Policy Analysis, Health information System, Public Health Nutrition, Reproductive Health and Population, Occupational Health and Safety and Social Pharmacology.

The venue of the 1st Phico is in Gran Dhika Hotel, Medan, Sumatra Utara, Indonesia. The speakers in the seminar came from four countries, namely
Indonesia, Malaysia, Thailand and Kuwait. There are 174 participants who managed to make a presentation in English. It can be said that the first Phico is running well.

With the large amounts of paper that go beyond what has been targeted by the committee, the committee conducted a more rigorous review process to maintain quality standards. The review process involves the reviewer from neighboring countries and local reviewer, who has become an international journal writer. After the three-time review process, it was decided to accept only 79 articles.

Thank you all for your participation and the hard work of the committees. See you at next year Phico 2017.

Turmeric Can Prevent Cochlear Damage Due To Ototoxic Drugs

Tengku S.H. Haryuna, Sari Anggraini
The high use of ototoxic drugs, especially antibiotics such as aminoglycosides and anticancer drugs such as cisplatin still can not be avoided as a therapeutic option. The use of ototoxic drugs can cause damage to the cochlea, vestibule, and semicircular canals leading to hearing loss and balance disorders.

Abstract
The high use of ototoxic drugs, especially antibiotics such as aminoglycosides and anticancer drugs such as cisplatin still cannot be avoided as a therapeutic option. The use of ototoxic drugs can cause damage to the cochlea, vestibule, and semicircular canals leading to hearing loss and balance disorders. Our previous study has found that curcumin extracted from turmeric (Curcuma longa L.) is capable of preventing damage to cochlea of rats exposed to noise at the level of molecular biology (protein level) through the decreased apoptotic index, oxidant status, and increased antioxidant status. Cochlear damage due to ototoxic drugs can occur through the similar pathways, thus we have a strong hypothesis that the cochlear damage due to ototoxic drugs may also be prevented by curcumin. If it is proven in animal studies, the study could be tested on humans (clinical trials) so that curcumin can be used as a herbal medicine to prevent hearing loss.

Abstract—The high use of ototoxic drugs, especially antibiotics such as aminoglycosides and anticancer drugs such as cisplatin still cannot be avoided as a therapeutic option. The use of ototoxic drugs can cause damage to the cochlea, vestibule, and semicircular canals leading to hearing loss and balance disorders.

Our previous study has found that curcumin extracted from turmeric (Curcuma longa L.) is capable of preventing damage to cochlea of rats exposed to noise at the level of molecular biology (protein level) through the decreased apoptotic index, oxidant status, and increased antioxidant status. Cochlear damage due to ototoxic drugs can occur through the similar pathways, thus we have a strong hypothesis that the cochlear damage due to ototoxic drugs may also be prevented by curcumin.

If it is proven in animal studies, the study could be tested on humans (clinical trials) so that curcumin can be used as a herbal medicine to prevent hearing loss.

Keywords—curcumin, ototoxic, cochlea, hearing loss.

I. INTRODUCTION

Hearing plays a pivotal role in social relationships and one of the causes of hearing impairment is ototoxic drugs. One type of drug inflicting hearing impairment is gentamicin, an aminoglycoside antibiotic [1]. The incidence of cochlear damage caused by aminoglycoside is equal to 7-90%, its rate varies greatly due to differences in study designs and methodologies [2].

Aminoglycosides are ototoxic drugs, widely prescribed due to their effective antimicrobial action and affordable prices [3]. Aminoglycosides are classified as the basic drugs used to treat gram-negative bacterial infections, but gentamicin can cause permanent damage to the sensory hair cells in humans and mammals [4].

Aminoglycosides have the ability to produce an active metabolite that can catalyze the formation of ROS (reactive oxygen species), a highly reactive compound. The human body has a defense system against ROS in the form of antioxidant agents, namely superoxide dismutase, glutathione and catalase [5].

Aminoglycosides-induced ototoxicity develops from low to high frequency, related to oxidative stress. Aminoglycosides, eg. Gentamicin, may react with iron to produce ROS in the inner ear, resulting in permanent damage to hair cells and neurons. Excessive ROS levels trigger the apoptotic pathway, which then produces cell death due to aminoglycoside-induced ototoxicity. Even though aminoglycoside-induced ototoxicity is well-documented, its molecular mechanisms still have not been precisely determined [6].

Noise is defined as an unwanted, unpleasant and disturbing sound since it can potentially cause disruption or damage to the inner ear organs [7]. Continuous noise exposure over an extended period of time causes damage to various structures gradually in the cochlea, initially affects higher frequencies, then spreads to lower frequency [7], [8].

Reference [9] found the increased expressions of HSP-70, TNF-α, IL-6, NFκB, TLR-2, TLR-4 and MMP-9 as well as the decreased expressions of Type II and IV Collagen in cochlear fibroblasts of Rattus norvegicus due to noise exposure with frequency of 1-10 kHz in the dose variation of noise intensity of 100 dB SPL for 15 minutes, 91 - 100 - 110 - 120 dB SPL for 2 hours.

Curcumin is a yellow pigment belonging to a group of phenolic compounds extracted from the rhizome of Zingiberaceae plant family, including: Curcuma longa Linnaeus (synonymous with Curcuma domestica Valeton or turmeric) and Curcuma xanthorrhiza Roxburgh or Java turmeric, often used as a seasoning and coloring agent [10]. Curcumin is known to have a broad spectrum of biological activities as an antioxidant; anti-inflammatory; inhibit initiation, promotion and metastasis of tumor; prevent and treat cancer;
antiviral; antibacterial; antifungal; antiamyloid; immunomodulator that activates T cells, B cells, macrophages, neutrophils, NK cells and dendritic cells; has the potential to treat allergies, arthritis, Alzheimer's disease and other chronic diseases mediated through the regulation of various transcription factors, growth factors, inflammatory cytokines, protein kinases and other enzymes [11]-[13].

According to a number of studies that have been conducted, curcumin has been shown to reduce the expressions of cytokines such as IL-1, IL-2, IL-6, IL-8 and chemokines, plays a role in the suppression of NFκB activation [14], inhibits inflammatory processes due to TLR-4 and MyD88 [15], decreases the expressions of MMP-2 and MMP-9 [16], increases the expressions of Type III and IV Collagen [17], inhibits the binding of AP-1 via MEKK1-JNK pathway, blocks the phosphorylation of JNK and c-Jun; cell cycle (cyclin D1 and cyclin E); apoptosis (caspase activation and "down-regulation" of anti-apoptosis gene products); proliferation (HER-2, EGFR, AP-1); P13K/AKT survival pathway; invasion (MMP-9 and adhesion molecules); angiogenesis (VEGF); metastasis (CXCR-4); inflammation (NFκB, TNF, COX-2, 5-LOX) [10], [18], [19].

II. PUBLICATION OF RESULTS

In previously published studies, the authors have proved that curcumin is able to prevent damage to the cochlear fibroblasts via several pathways, namely inflammatory, oxidative metabolic and apoptotic pathways. The studies were divided into 4 groups using 24 male Wistar rats (Rattus norvegicus), which consisted of group 1 (control), group 2 (exposed to noise of 100 dB 2 hours per day for 14 days), group 3 (exposed to noise of 100 dB 2 hours per day followed by the administration of 50 mg curcumin for 14 days) and group 4 (exposed to noise of 100 dB 2 hours per day followed by the administration of 100 mg curcumin for 14 days). Results of the study has found that curcumin is able to increase the expressions of SOD and CAT concentration [20]; decrease the expressions of MDA and H₂O₂ concentration [21]; decrease the expressions of calcineurin, NFATc1, apoptotic index [22]; and decrease the expressions of AP-1 [23] on cochlear fibroblasts of Rattus norvegicus.

III. ADVANCED STUDY

Histopathologically, similar findings are detected between cochlear damage due to noise exposure and cochlear damage due to ototoxicity. Cochlear histopathological damage caused by aminoglycosides, macrolides, cisplatin and loop diuretics may demonstrate damage to the hair cells, stria vascularis, degeneration of VIII nerve fibers and spiral ganglion cells [24]-[26].

Those findings make the authors believe that damage to cochlear fibroblasts caused by ototoxicity can also be prevented with curcumin.

IV. HYPOTHESIS

Curcumin can prevent damage to cochlear fibroblasts caused by ototoxicity.

Indexing

All articles of these proceedings are submitted for indexing in CPCI, CNKI and Scholar Google. Optionally we also submit to Compendex and Scopus.

Note that in case you need information about the indexing of these proceedings, please check with the organisers of the conference as we cannot reply to messages received from participants.

Free access

In order to increase the visibility of its conference and of the papers of its participants, this conference has chosen to sponsor the on-line publication of the conference papers. Therefore, all conference papers can be read and downloaded for free, no subscription or other payment is required.

Copyright

Atlantis Press adheres to the principles of Creative Commons, meaning that we do not claim copyright of the work we publish. We only ask people using one of our publications to respect the integrity of the work and to refer to the original location, title and author(s).

DOI

All articles have a digital object identifier (DOI). DOIs are standardised digital identities used across all major scientific publishers and are managed by CrossRef. DOIs guarantee a permanent Web-address of the article, no matter where it is physically stored. So, when referring to an article you can either use the traditional reference information (name of publication, volume, issue, etc.), or use the DOI. Many people now use both notations. More information on DOIs.

Archiving policy

To guarantee permanent archiving, Atlantis Press collaborates with the KB National Library of the Netherlands. All proceedings are uploaded to its e-depot after publication.

Print

In case you wish to have a print copy of the proceedings and no print version is available at Atlantis Press ('ISBN print = none' in the above box), then you can order one directly at our partner Curran Associates.

Atlantis Press

A professional publisher of scientific books, journals and proceedings, Atlantis Press offers world-class services, fast turnaround and personalised communication. Our proceedings and journals are published in Open Access on our platform, generating millions of downloads each month.
