ABSTRACT

Objective: To evaluate total phenolic, flavonoid content (TFC and TPC) and antioxidant activity of ethyl acetate fraction (ETF) of Picria fel-terrae Lour. herbs.

Methods: TPC and TFC in ETF were determined by Folin–Ciocalteu and colorimetric methods, and antioxidant activity was determined by 1,1-diphenyl-2-picrylhydrazyl (DPPH) method.

Results: ETF was found to contain low levels of phenolic (17.7±11.26 mg gallic acid equivalent/g), total flavonoid (14.43±0.03 mg quercetin equivalents/g), and antioxidant activity from DPPH assay was measured as inhibitory concentration 25.72±10.13 µg/mL.

Conclusions: The results reveal that ETF of P. fel-terrae Lour. herbs has strong antioxidant activity. Our further study is to isolate the compounds which responsible for antioxidant components.

Keywords: Phenolic, Flavonoid, Antioxidant, P. fel-terrae Lour., Ethanol, Herbs.

INTRODUCTION

Free radicals are arising from metabolism process or environmental sources which interact simultaneously with the biological system. Reactive species are molecules or atoms that have an electronic stability and most reactive. Reactive oxygen species (ROS) are main sources of a primary catalyst which initiate the process of oxidation in vivo and in vitro and create oxidative stress. Oxidative stress products when reactive forms of oxygen are produced faster than they could be safely neutralized by antioxidant mechanisms and/or from a decrease in antioxidant defense. The uncontrolled production of oxygen free radicals and the undestabiliy system of antioxidant protection results in the cause of many diseases, such as cancer, diabetes, heart diseases, Alzheimer’s, and aging [1-6].

Antioxidants are the material when they present in low concentrations compared to those of an oxidizable substrate significantly defers or avoids oxidation of that substances ethnopharmacological studies conducted and expressed that a large number of indigenous plant species are being used as a source of herbal therapies [7,8].

Pogoniano (Picria fel-terrae Lour.) have been used as a drug of colic, malaria, diuretic, fever, and skin disease [9]. Modern pharmacological investigations indicated that the extract of P. fel-terrae Lour. exerts diuretic, anti-inflammatory, antihyperglycemic, anti-inflammatory, anti-inflammator, and analgesic activities [10-19]. Moreover, P. fel-terrae inhibit hepatitis B (HB) e-antigen excreted by HepG2 2215 cell lines, suggesting to have anti-HB virus activity [20]. It can be developed as a co-chemotherapeutic regimen for breast cancer by inducing apoptosis and cell cycle arrest and suppressing cytokin D1 and Bcl-2 expression based on the recent studies [21,22]. In in vitro analysis: Picroferractan IA and JR-3 potential P4X3 and epidermal growth factor receptor inhibitor [23]. The aim of this study was to determine total phenolic and flavonoid content (TFC and TFC) and antioxidant activity of ethanol fraction of P. fel-terrae Lour. herbs.

METHODS

Plant and chemicals material
Fresh herbs of P. fel-terrae Lour. were collected from Tiga Lingga village, Dairi regency, Sumatera Utara province, Indonesia. Chemicals used were ACl, 6H2O (Merck), distilled water, 1,1-diphenyl-2-picrylhydrazyl (DPPH) (Sigma), Folin–Ciocalteu (Sigma), gallic acid (Sigma), Quercetin (Sigma), sodium acetate (Merck), and sodium bicarbonate (Merck).

Preparation of ethyl acetate fraction (ETF)
The air-dried and powdered herbs of P. fel-terrae Lour. (1 kg) were repeatedly fractionated by maceration with n-hexane (3×3 day, 7,5 L), the powder was dried in the air and fractionated with ethyl acetate (3×3 day, 7,5 L), the powder was dried in the air and fractionated with ethanol (3×3 day, 7,5 L) at 25-30°C with periodical stirring. The filtrate was collected, and then evaporated to obtain a viscous fraction and then freeze dried to dry [7,10,21,24].

Determination of total phenol content (TPC)
The TPC of the sample was determined using Folin reagent. Briefly, 100 µL of ETF (500 µg/mL) was mixed with 7,9 mol of distilled water and 0,5 mL of Folin–Ciocalteu’s reagent (1:10 v/v) and mixed using vortex for 1 minute. After mixing, 1,5 mL of 20% sodium bicarbonate solution was added, and the mixture was incubated for 90 minutes with intermittent shaking. The absorbance was determined at 775 nm with a spectrophotometer. Total phenolic concentration is interpreted as gallic acid equivalent (GAE) in mg/g of extract. The methanol solution was to use a blank control [25,10,25]. The equation to determine total phenolic concentration:

\[ C(GAE) = \frac{c \times V}{M} \times F \]

C(GAE): Content of phenolic as GAE, c: Concentration determined from standard curve (µg/mL), V: Volume which used in the assay (mL), M: Mass of the sample which used in the assay (g), and F: Dilution factor.
determination of TFC
The amount of total flavonoids in the extracts was determined in methanol was mixed with 0.10 mL of 10% aluminum chloride and 2.80 mL of distilled water. After incubation along 40 minutes, determine the content of flavonoids, we prepared a calibration curve quercetin equivalents (QF) in mg/g of extract [2,26]. The equation:

\[ C(QE) = \frac{C \times V}{M} \]

C(QE): Content of flavonoid as QE, C: Concentration determined from standard curve (µg/mL), V: Volume which used in the assay (mL), M: Mass of the sample which used in the assay (g), and D: Dilution factor.

Free radical scavenging activity test
The DPPH assay was carried out according to the previous study with some modifications [27]. 0.2 mM solution of DPPH in methanol was prepared, and 100 µL of this solution was added to various concentrations of ETF at the concentrations of 12.5, 25, 50, and 100 µg/mL. After 60 minutes, absorbance was measured at 516 nm. Quercetin was used as the reference control, and percentage of inhibition was calculated by comparing the absorbance values of the control and test samples [2,5].

Percentage of inhibition = \( \frac{Abs \text{-control} - Abs \text{-test}}{Abs \text{-control}} \times 100\% \)

Statistical analysis
Data were expressed as mean ± standard deviation, which were analyzed using the SPSS 20 software.

RESULTS AND DISCUSSION
TFC and ETF
TFC was determined by the Folin-Ciocalteau method [28]. The ETF of P. fel-terrae Lour. herbs was found to contain low levels of phenolic content 17.71±1.26 mg GAEE/g. Phenolic compounds are known as antioxidant [29], and they are very important plant constituents because of their free radical scavenging activity due to their hydroxyl groups [30].

In the case of ETF, the ETF was given flavonoid content 14.43±0.03 mg QE/g. Flavonoids are a group of polyphenolic compounds, which exhibit several biological effects such as anti-inflammatory, antihypertensive, anti-ulcer, anti-allergic, antiviral, and anti-cancer activities [31]. They are capable of effectively scavenging the ROS because of their phenolic hydroxyl groups, and so they are potent antioxidants also [32].

Anti-radical activity
Antioxidant power of the plant samples was measured in term of hydrogen donating ability using DPPH which is a stable, nitrogen-centered free radical and produces deep purple color in methanol solution [33]. DPPH test, which is based on the ability of DPPH, a stable free radical, to decolorize in the presence of antioxidants, is a direct and reliable method for determining radical scavenging action [34] and has been largely used as a quick, reliable and reproducible at in vitro antioxidant activity assay [35]. The reducing capacity of compounds could serve as an indicator of potential antioxidant property [36-39]. Inhibitory concentration for ETF and Quercetin in DPPH assay was 25.72±0.13 µg/mL and 4.94±0.05 µg/mL, respectively.

CONCLUSION
The result of this study showed that ethanol fraction of P. fel-terrae Lour. possess antioxidant activity.
